Tritium Yagdur		
31	/40	Casting Quality
	/25	Complexity
	/15	Texturing
	/10	Stem Fit/Butts
	/10	Other
7	/100	Total

Notes

Casting Quality

Not just one, but two tritium vials encapsulated in the eyes of Yagdur with nearly perfect horizontal alignment between both eyes is truly a testament to the casting quality of this switch. As well, the glow-in-the-dark aspect of the eyes plays very well with the red and purple rocky exterior which is nicely carved while still keeping the readability of the sculpt intact.

Complexity

While coming down a little bit in terms of complexity given the fact that it's a pretty simplistic one shot cap, it more than certainly earns its points back in the usage of literal radioactive material that would have sent a lot more than just Ukrainians after Doc Brown if he were to use this in Back to The Future.

Texturing

I mean, it's a rock. It's going to have texture. To try and say anything texturally in this cap isn't indicative of a literal rock seems dumb as... well, a rock.

Stem Fit/Butt

With a fairly decent fitting, perhaps ever so slightly loose fitting but on these switches, it fits well on most MX style switches without a hassle.

Other

The tritium vials in the eyes of these things are absolutely insane in how much hair loss they have caused me. I'm not even talking about radioactivity; I'm talking pure stress alone. Do you know how many government agencies put you on lists just trying to take this on a board with you on a business trip? I literally spent 3 days in prison in fucking Dagestan because they couldn't get ahold of Nubbinator to verify that this is actually art and that I'm not a spy. What kind of James Bond would a literal goat even make anyhow? I'm pretty sure this is also starting to turn my scorecards radioactive as well.
